Contents

Executive Summary.....	1
Background and project objectives	1
An overview of the size of the industry sector in New South Wales.....	2
Sites and locations of site waste assessments.....	3
Data interpretation and challenges.....	5
Disclaimer for extrapolation of data.....	7
Main findings in regards to types of materials in general waste stream per Division/Sub-division and overall	7
Identification of Division/Sub-division generating waste and divertible materials	10
1. Introduction.....	16
1.1 Project background.....	16
1.2 Breakdown of the industry sectors	17
2. Methodology	19
2.1 Planning	19
2.2 Specific stages	19
2.2.1 Staff training.....	19
2.2.2 Business recruitment.....	20
2.2.3 Preliminary data gathering	21
2.2.4 Waste assessment process including visual assessment of compactors.....	21
2.2.5 Data/information follow up and individual site report preparation.....	22
2.2.6 WHS management.....	23
2.3 Division/Sub-divisions analysed.....	23
3. Results – Key findings	25
3.1 Number of waste assessments conducted per industry division/sub-division, area and region	25
3.2 Overall composition of C&I waste streams by small/medium/large per Division/Sub-division.....	31
3.2.1 Total Tonnes of C&I Waste by ANZSIC Division and Sub-division per Areas and Regions	32
3.2.2 Total Tonnes of C&I Waste by streams per Areas and Regions	38
3.2.3 General Waste Tonnes of C&I Waste per Areas and Regions	42
3.2.4 Total tonnes of C&I waste by streams, ANZSIC division, per area and region	43
3.3 Overall composition of waste and materials recycled per Division/Sub-division and within each Regional Groups per SMA/ERA.....	55
3.3.1 Overall composition of waste and materials by areas.....	55
3.3.2 C - Manufacturing	63
3.3.2.1 C - Manufacturing Waste Streams Overall Composition	63
3.3.2.2 C11 – Food Manufacturing Waste Streams Overall Composition	65
3.3.2.3 C – Other Manufacturing Waste Streams Overall Composition.....	66
3.3.3 F - Wholesale Trade.....	68

3.3.3.1	F – Wholesale Trade Waste Streams Overall Composition.....	68
3.3.4	G - Retail Trade Overall	70
3.3.4.1	G – Retail Trade Waste Streams Overall Composition.....	70
3.3.4.2	G41 – Food Retailing Waste Streams Overall Composition.....	72
3.3.4.3	G42 – Other Store-Based Retailing Waste Streams Overall Composition	73
3.3.5	H - Accommodation and Food Services	75
3.3.5.1H	H – Accommodation and Food Services Waste Streams Overall Composition	75
3.3.5.2	H44 – Accommodation Waste Streams Overall Composition.....	77
3.3.5.3	H45 – Food and Beverages Services Waste Streams Overall Composition	78
3.3.6	I - Transport, Postal & Warehousing	80
3.3.6.1	I - Transport, Postal & Warehousing Waste Streams Overall Composition	80
3.3.7	J-O - Office Based Industries	82
3.3.7.1	J-O – Office Based Industries Waste Streams Overall Composition	82
3.3.8	P – Education and Training	84
3.3.8.1	P – Education and Training Waste Streams Overall Composition	84
3.3.9	Q – Health Care and Social Assistance.....	86
3.3.9.1	Q – Healthcare and Social Assistance Waste Streams Overall Composition	86
3.3.10	R – Arts & Recreation Services	88
3.3.10.1	R – Arts & Recreation Services Waste Streams Overall Composition	88
3.4	Issues with data such as conversion of volume to weight	90
3.5	Current systems for general waste and recyclables per Division/Sub-division.....	90
3.6	Bulk densities for the specific materials	92
3.7	Benchmarking.....	93
4.	Statistical Analysis of Site-based Waste Audits.....	97
4.1	Total waste audited – All ANZSIC Codes.....	98
4.1.1	Probability distribution	102
4.2	C – Manufacturing	103
4.2.1	Probability distribution	105
4.3	F - Wholesale Trade	106
4.3.1	Probability distribution	108
4.4	G - Retail Trade	109
4.4.1	Probability distribution	111
4.5	H - Accommodation and Food Services.....	112
4.5.1	Probability distribution	114
4.6	I - Transport, Postal and Warehousing.....	115
4.6.1	Probability distribution	117

4.7	J-O - Office Based Industries	118
4.7.1	Probability distribution	120
4.8	P - Education and Training	121
4.8.1	Probability distribution	123
4.9	Q - Health Care and Social Assistance	124
4.9.1	Probability distribution	126
4.10	R - Arts and Recreation Services	127
4.10.1	Probability distribution	129
4.11	Discussion & Recommendations	130
5.	Comment on specific issues and/or materials	131
5.1	Materials recoverable	131
6.	Conclusions	133
7.	Recommendations	135
7.1	Future actions to enhance landfill diversion	135
7.2	Infrastructure/resource issues – SMA/ERA	135
8.	Appendices	136
	Appendix 1 – Data	136
	Appendix 2: Pro forma site specific report	267
	Appendix 3: Project photographs	274
	Appendix 4 – Waste assessment material categories	290
	Appendix 5 – Forms used	292
	Appendix 6 – Waste density data	295
	Appendix 7 – Safe Work Method Statement	296

Executive Summary

Background and project objectives

The NSW Government undertook surveys of the commercial and industrial (C&I) waste stream in Sydney in 2003 and 2008. In February 2013, the NSW Government announced the five-year \$465.7 million Waste Less Recycle More initiative, including a \$60-million *Waste and Recycling Infrastructure Fund*.

This fund includes two audits of the Commercial and Industrial (C&I) Waste Stream in the regulated areas of New South Wales.- Sydney Metropolitan Area (SMA), Extended Regulated Area (ERA) and Regional Regulated Area (RRA). The first audit was completed in 2014 and a follow up audit is scheduled for 2017. These two audits aim to:

- inform infrastructure and other investment decisions made under the NSW Government's *Waste Less, Recycle More* program
- inform regional and sub-regional waste and resource recovery planning
- provide baseline data to assess the impact of the infrastructure funding program on resource recovery in the period 2013/14 to 2016/17 and beyond
- inform the waste and resource recovery industry and businesses from the key industry sectors about C&I waste composition, particularly information on recyclable materials
- inform the government, waste industry and businesses on the trends in the composition of the C&I waste stream in SMA for the period from 2003 to 2008 and 2014
- assist NSW EPA in developing business recycling programs to divert more materials away from landfills
- characterise the various streams or transport modes that enter landfills and transfer stations.

The 2014 C&I waste audit included a disposal-based audit (DBA) – visual assessment of C&I loads delivered at selected landfills and transfer stations, an audit of garbage bags disposed at these facilities and a generator site-based audit. Key findings from these three audits are published online in separate [reports](#).

This is the first time a generator site-based audit (GSA) targeting 250 businesses of small, medium and large size from select industry sectors has been undertaken by the NSW Government. A specific objective of this source-based audit is to determine the composition of waste by business size and industry sector and to assess waste management systems in use and potential for improved recycling on site. Whilst the DBA and the garbage bag audits were undertaken in SMA, ERA and RRA, the GSA was limited to SMA and ERA (the metropolitan levy area).

This report details the results obtained from the GSA using visual assessment of the waste and recyclables stored in different types of containers at the collection point at businesses of different size within select Australian and New Zealand Standard Industry Classification (ANZSIC) industry division/sub-divisions.

An overview of the size of the industry sector in New South Wales

Australian Bureau of Statistics (ABS) data was used to assist in profiling the number of businesses within each of the nominated ANZSIC industry division/sub-divisions by EFTE (Equivalent Full-Time Employees) and location (SMA or ERA).

To obtain this detail and confirm EPA sample selection, ABS publications referenced were:

- ABS catalogue number: 8165.0, Counts of Australian Businesses including entries and exits – “*Businesses by Main State by Industry Class by Employment Size Ranges*”
- ABS catalogue number 8155.0, Australian Industry – “*Australian industry by division*”

Based on these publications, the following table summarises the reported number of businesses according to the available ABS data (as per EFTE and location).

Table 1 – Business profile by division, size and location

ANZSIC Division	SMA			ERA		
	Employment Range (Size)			Employment Range (Size)		
	5-19	20-199	200+	5-19	20-199	200+
C - Manufacturing	762	277	12	163	40	0
F - Wholesale Trade	760	288	16	108	21	3
G - Retail Trade	1,279	317	12	269	69	3
H - Accommodation and Food Services	1,193	439	26	273	104	3
I - Transport, Postal and Warehousing	198	86	13	52	24	0
J–Information Media and Telecommunications	161	80	11	0	12	0
K–Financial and Insurance Services	610	219	61	81	15	0
L–Rental, Hiring and Real Estate Services	522	90	9	97	20	0
M–Professional, Scientific & Technical Services	2,272	676	50	281	54	3
N–Administrative and Support Services	775	463	49	119	42	3
O–Public Administration and Safety	74	37	6	3	6	0
P–Education and Training	238	147	15	40	19	0
Q–Health Care and Social Assistance	1,013	212	31	199	45	3
R–Arts and Recreation Services	106	59	6	25	18	0

The ABS classifies business size based on Australian Business Number (ABN) information. As an example, the above table indicates that in the ERA, there are three businesses in the Division *H - Accommodation and Food Services* with an EFTE of 200+. However, this in reality meant that there could be several businesses at different locations that may be grouped under one business that has one ABN. The data from ABS also indicated the local government area where these specific businesses were located. This then enabled targeting of recruitment activities to meet EPA objectives.

As an example, the ABS data indicated that there were only three facilities that were categorised as “large” in the ERA. Drilling down into the data revealed that these were located in the Wollongong Region, so recruitment actions focussed on that area rather than other areas within the ERA.

Sites and locations of site waste assessments

The following tables illustrate the number of waste assessments that were conducted in relation to area (SMA or ERA) and division/sub-division. In total 197 sites participated in this project which was 80% of the target number of 250 sites. Of these 73% were located in the SMA and 27% in ERA.

Table 2: Total number of site waste assessments – all areas

	Small (5-19 EFT)		Medium (20-199 EFT)		Large (>200 EFT)		Total
	No. of sites	% of total	No. of sites	% of total	No. of sites	% of total	No. of sites
Total	92	47%	79	40%	26	13%	197

Table 3 illustrates the proportion of the total audited business for each of the required Divisions whilst Table 4 breaks this data into the size of the business again per Division.

Data interpretation and challenges

The auditor encountered difficulties in recruiting required number of businesses of the selected size and from industry division/regions and complete assessments on site within the timeframe stipulated in the contract.

This led to only 80% of the targeted sample size or 250 businesses audited. This resulted in some industry divisions and regions under-represented offering limited statistical confidence in the data collected.

In this report, data from those industry divisions and regions that are under-represented have been included in the Appendices.. This data should only be used for information as a representation of the types and quantities of wastes and recyclables generated from these divisions and regions.

The challenges encountered by the auditor in undertaking this pilot audit can be broadly attributed to:

1. Recruitment; and
2. Obtaining data from the participating businesses.

In regards to recruitment, the main issues identified by the auditor were:

- Ensuring businesses met acceptance criteria (employment size, industry division and location)
- Small businesses did not perceive the project to be of benefit to them whereas some of the larger business put forward a number of sites in their portfolio. In all instances, if audits were undertaken at multiple sites operated by one organisation, all audits were managed as individual audits with data gathered applied to that specific site.
- Small businesses were in some cases difficult to recruit due to time restraints and multiple approaches made by the EPA – Bin Trim program and other regulatory requirements
- Significant lead time required for many businesses to agree to participate or getting the appropriate person in the larger organisations to sign-off on participation

Issues that impacted on business recruitment process were:

- Organisations would take time in responding as to participating in the program (or not).
- Benchmarking information was not always available and participants often did not know where or how to access the information.
-
- For the above reasons, participants took a long time to respond to (often repeated) requests for the information. Participants also had to wait for required information to be supplied by other departments and as such were unable to provide what was requested.
- Further, in spite of outlining the benefits to the businesses by participating in this audit, some businesses perceived this audit as a regulatory activity of EPA and hence elevated decision making to senior managers (specifically for Medium and Large) organisations, taking more time.
- Recruiting small offices that “share” waste systems makes it difficult to accurately assess business specific generation.
- Ensuring businesses met acceptance criteria (employment size and location)
- Small businesses did not perceive the project to be of benefit to them whereas some of the larger business put forward a number of sites in their portfolio
- With data gathering, while the business had agreed to participate, there could be a lack of understanding as to collection schedules, volumes collected and in several instances what streams were managed on-site. This then made scheduling the on-site waste assessment when bins are effectively full.
- In some instances, lack of co-operation from waste operators made it difficult to undertake visual assessment of compactors delivered to disposal sites.

Another issue that impacted on business recruitment was the fact that while the EPA sample had a range of business sizes within nominated ANZSIC Divisions, use of ABS data does not necessarily help to identify a business of a particular size from a nominated industry division in a particular region.

As an example, the EPA required 10 large businesses (i.e., >200 EFT employees), within “H Accommodation & Food & Services” Division, of which 75% were to be “Food & Beverage Services”. In undertaking recruitment using ABS data, it was found that while some businesses did have >200 employees (permanent and casuals),, when this number was converted to EFT, it meant that the business size was then classified as a medium size business. Alternatively as indicated, it may also have been that the reported employee size was spread over a number of separate locations.

The highly variable nature of waste generation in the C&I sector, combined with the inherent inaccuracies associated with conducting visual waste audits, means that a very large sample size is required to achieve a good level of accuracy at a high level of confidence. The statistical analysis showed that, for at least some Divisions, there were not sufficient number of samples to produce the accuracy and confidence required. Therefore, end users need to consider their requirements before using the data in this report as their sole source of information. In the absence of other data, this study presents a valuable data resource for the waste industry.

Caution must be applied in how the data gathered from these GSA audits is utilised such as extrapolation to provide a profile for Divisions/Sub Divisions. This data is accurate in regards to the types and quantities of wastes and recyclables generated from the businesses that were audited. But the audits indicated that there are differences in terms of types of materials and the quantities as well as how they are managed within and across the Divisions. It is for this reason that caution is advocated – for example some organisations within the Healthcare Division generate large volumes of organic waste, and others very little.

In addition, the audits provide an understanding of systems used and management approaches (as well as limitations), for the ANZSIC Divisions that were included in the project. However there is a high degree of variability in regards to waste generation (types and quantities), systems used for the consolidation of waste(s) across Divisions and Areas (i.e., SMA and ERA).

Using the Healthcare Division again as an example, one organisation has introduced multiple streams to maximise landfill diversion. This involves use of compactors, various bin types (e.g., 240 litre Mobile Garbage Bins and three cubic metre size front lift containers), in conjunction with staff awareness training and rigorous monitoring. Another organisation within the same Division recycles paper/cardboard and comingled materials with everything else landfilled. Part of the reason for the latter organisation’s management system is cost of transport as they are located within the ERA.

Disclaimer for extrapolation of data

All care was taken by the auditor in data gathering from the organisations participating in these GSA audits. The data obtained from the site assessments (e.g., types and quantities of materials in bins and the types of systems employed), was gathered first hand. Other necessary data for this project relied on provision of invoices (which were not always supplied), internal waste management reports that contained generation rates per stream, comments made during interviews and other sources.

However, waste/recycling bins were not always full or contained some materials generated intermittently and therefore again reliance was placed on second hand information to endeavour to be as accurate as possible in developing the waste profile for each organisation.

In addition, the number of individual organisations from each Division as previously indicated showed variability in their waste profiles and management systems as well as in some instances only a small sample was audited.

Main findings in regards to types of materials in general waste stream per Division/Sub-division and overall

Based on the sample size, Table 7 summarises the total quantity of C&I waste **generated** (both general waste and diverted) by audited businesses in all divisions/sub-divisions for both the SMA and ERA. Table 8 expands this data to provide the detail as per each separate division/sub-division.

In total, 78,947 tonnes of general waste were recorded as being generated for all businesses audited for all areas. As per Table 7, the majority of this waste is generated by medium size audited businesses, followed by large and then small (based on employment size).

As per Table 8, Food Manufacturing generates the highest quantity of waste (45.2 %) from audited businesses for all areas and employment sizes followed by Wholesale Trade (30.9%).

Identification of Division/Sub-division generating waste and divertible materials

Tables 10, 11 and 12 illustrate the quantities of waste and divertible materials generated as per each individual division/sub-division and by SMA/ERA.

As illustrated in the tables, currently the audited ANZSIC divisions/sub-divisions general waste streams represent 33% by weight with materials currently diverted representing 67% for all areas. A similar percentage relates to the SMA (32% and 68% respectively, but with a lower rate of currently diverted material in the ERA (57%).

The data in the following table is from the audited businesses. It represents the current rates of general waste and diversion specific to these audited businesses. Comparisons of such points as diversion rates with other audit projects should ensure careful analysis of methodology (e.g., Divisions, size of business and locations audited as well as the process for obtaining data including compositional data).

Table 10: Total tonnes of C&I waste and divertible materials by ANZSIC Division and Subdivision Generated by Audited Businesses – All Areas

Total	26,121.5	33.1%	52,825.9	66.9%	78,947.4

Tables 11 and 12 demonstrate the diversity of activity in respect to current management of waste and diverted materials by the ANZSIC divisions/sub-divisions, Area and size(s) of the businesses. There are some similarities, such as Food Product Manufacturing diverting 79% and 78% in the SMA and ERA respectively.

1. Introduction

1.1 Project background

In February 2013, the NSW Government announced the five-year \$465.7 million Waste Less Recycle More initiative, including a \$60-million *Waste and Recycling Infrastructure Fund*. This fund includes two audits of the Commercial and Industrial (C&I) Waste Stream in the regulated areas of New South Wales.- Sydney Metropolitan Area (SMA), Extended Regulated Area (ERA) and Regional Regulated Area (RRA). The first audit was completed in 2014 and a follow up audit is scheduled for 2017. These two audits aim to:

- inform infrastructure and other investment decisions made under the NSW Government's *Waste Less, Recycle More* program
- inform regional and sub-regional waste and resource recovery planning
- provide baseline data to assess the impact of the infrastructure funding program on resource recovery in the period 2013/14 to 2016/17 and beyond
- inform the waste and resource recovery industry and businesses from the key industry sectors about C&I waste composition, particularly information on recyclable materials
- inform the government, waste industry and businesses on the trends in the composition of the C&I waste stream in SMA for the period from 2003 to 2008 and 2014
- assist NSW EPA in developing business recycling programs to divert more materials away from landfills
- characterise the various streams or transport modes that enter landfills and transfer stations.

The 2014 C&I waste audit included a disposal-based audit (DBA) – visual assessment of C&I loads delivered at selected landfills and transfer stations, an audit of garbage bags disposed at these facilities and a generator site-based audit. Key findings from these three audits are published online in separate [reports](#).

This is the first time a generator site-based audit (GSA) targeting 250 businesses of small, medium and large size from select industry sectors has been undertaken by the NSW Government. A specific objective of this source-based audit is to determine the composition of waste by business size and industry sector and to assess waste management systems in use and potential for improved recycling on site. Whilst the DBA and the garbage bag audits were undertaken in SMA, ERA and RRA, the GSA was limited to SMA and ERA.

This report details the results obtained from the GSA using visual assessment of the waste and recyclables stored in different types of containers at the collection point at businesses of different size within select Australian and New Zealand Standard Industry Classification (ANZSIC) industry division/sub-divisions.

The information included in this report will assist the NSW Government, businesses and the waste and resource recovery industry to understand the composition of waste and recyclables generated on site, contemporary waste management systems in use at present and identify opportunities to improve the quality and quantity of recycling at source. The results from this audit program will be a significant contributor to the evidence base that will inform the outcomes of the NSW Waste and Recycling Infrastructure Funding Program and complement other NSW government initiatives such as the BinTrim, Love Food Hate Waste and Industrial Ecology Programs.

1.2 Breakdown of the industry sectors

Australian Bureau of Statistics (ABS) data was used to assist in profiling the number of businesses within each of the nominated ANZSIC industry division/sub-divisions by EFTE and location (SMA or ERA).

To obtain this detail and confirm EPA sample selection, ABS publications referenced were:

- ABS catalogue number: 8165, Counts of Australian Businesses including entries and exits – “*Businesses by Main State by Industry Class by Employment Size Ranges*”
- ABS catalogue number 8155.0, Australian Industry – “*Australian industry by division*”

The following table profiles the targeted ANZSIC industry division by employment numbers within New South Wales. This allows for an understanding of the size of each of these divisions. This data is of value for extrapolating the GSA waste audit data to provide a profile per business type and size for New South Wales in total. From this waste generation/diversion per EFT can be established to determine individual businesses opportunities for improvement and measure progress.

Table 16: Business profile by division and employment numbers

	Employment at end June ('000)			
	2008–09	2009–10	2010–11	2011–12
Manufacturing	293	290	271	282
Wholesale trade	192	205	220	219
Retail trade	393	404	416	404
Accommodation and food services	280	297	302	325

Information Media and Telecommunications	74	77	78	78
Rental, hiring and real estate services	127	124	131	131
Professional, scientific and technical services	321	335	336	353
Administrative and support services	235	257	283	321
Public administration and safety (private)	22	22	27	26
Education and training (private)	98	107	121	120
Health care and social assistance (private)	265	271	311	319
Arts and recreation services	54	54	60	62
Total	3,167	3,247	3,415	3,485

Table 17 illustrates the reported number of businesses according to the available ABS data (as per EFTE and location). It is this data that enables the targeting of recruitment activities to meet the GSA objectives and specific numbers and sizes of businesses per area (i.e., SMA and/or ERA).

Table 17: Business profile by division, size and location

ANZSIC	SMA			ERA		
	Employment Range (Size)			Employment Range (Size)		
	5-19	20-199	200+	5-19	20-199	200+

Reference: Businesses by Industry Division by Statistical Area Level 2 by Employment Size Ranges, June 2013, Australian Bureau of Statistics, Counts of Australian businesses, including entries and exits, June 2009 to June 2013, Catalogue No. 8165.0, June 2014, Canberra

There are differences between the breakdown of the numbers of organisations (both in size and location), between the ABS data and the required business per Division/Size/Area that the EPA required to be sampled for the GSA audits. However, the sample to be audited was determined by SRU based on their research and this is what the EPA required. Despite this difference between ABS and the EPA profiles, the sample required to be audited is fundamentally valid.

2. Methodology

This section summarises the methodology used in this audit. The design of the audit addressing sample sizes, target ANZSIC industry divisions and regions to be audited was undertaken by Sustainable Resource Use Pty Ltd in consultation with the NSW Government panel of waste auditors and the audit was undertaken by Waste Audit and Consultancy Services (WACS) as a sub-contractor to A. Prince Consulting.

2.1 Planning

WACS assigned a senior staff member as the Project Manager with extensive experience in conducting a broad range of waste audits to manage this project. The WACS project manager was responsible for the oversight of auditor recruitment and training, the conduct of the audits, data entry/analysis and development of opportunities as well as liaison with EPA. The project manager also liaised with the personnel responsible for management of the disposal site-based audit and the garbage bag sorting to ensure consistency across material categories and industry divisions audited as part of the major audit undertaken in 2014.

Progress reports on aspects of the project as agreed with EPA were developed and submitted on a fortnightly basis. These reports highlighted actions completed and any issues that had the potential to impact on the project.

2.2 Specific stages

The generator site-based audit targeting 250 businesses of different size and from several ANZSIC divisions was undertaken in the following three main stages:

1. business recruitment
2. conduct of the waste assessment
3. data analysis and report writing

However, it was important to ensure that there was a consistent approach to all activities to ensure that the data gathered was robust, could be used for benchmarking current practices and enable comparison with the future planned audits.

2.2.1 Staff training

The staff engaged in this audit were trained in the specific major tasks listed below. Since some staff may be involved in more than one aspect of the audit, all staff were trained in all aspects to ensure their competency in undertaking any tasks listed below:

Recruitment

- Project overview
- Examples of businesses within each ANZSIC division and geography of SMA and ERA
- Spreadsheet use and information requirements (i.e., what to ask and how to assist in obtaining the information)
- Engaging and determining eligibility for participation
- Waste systems
- Scheduling

Auditing

- Project overview
- WHS
- Conducting waste audits
- Data entry
- Identifying opportunities

Data Management

- Project overview
- Data input
- Validation and quality assurance methods
- Identifying opportunities

To assist with consistency in data collection, pilot audits were undertaken following the training program, with the selection of the sites spread amongst the different ANZSIC divisions and locations (i.e., SMA and ERA).

The pilot audits involved two auditors visiting the nominated sites. One auditor collected and recorded data with the other validating and reviewing the process.

The objective of the pilot audits were to:

- Ensure all auditors are following the same methodology
- Data is being accessed and recorded
- Unforeseen issues are identified and resolved
- Ensure the audit methodology is effective
- Ascertain whether existing density data is applicable and whether additional data requires collection

2.2.2 Business recruitment

ABS data was used as a primary resource and subsequently examined to ascertain the number of businesses and locations within each division (and sub-divisions) that was required to be included in the audit program.

Identification of potentially eligible businesses was based on data sourced from a broad range of associations and organisations such as:

- Australian Bureau of Statistics data/information
- Industry Associations, including:
 - Australian Hotels Association
 - Australian Private Hospitals Association
- Waste management contractors
- Office/Retail tenancy site managers
- Government agencies such as NSW Health and Education
- Previous clients

Waste Audit and Consultancy Services then developed a profile in regards to business location and size to enable them to determine the required sample size, to ensure an accurate composition of waste generation per each industry division (and sub-divisions) can be achieved (refer Table 1).

This profile assisted in targeting and recruiting activities, of businesses in accord with project objectives (refer Section 2.3 for information on sample size).

In conducting large audits such as this for either single or multi-sectors, multiple approaches are required during the recruitment process. Often the business's contact with the Professional Association (as an example) is not the same person who would approve involvement with this type of project. However, use of Associations has been shown to be an effective means of communicating with a broad range of business in terms of type (within the sector), size and location.

These Professional Associations and other organisations were requested to provide details of potential business. Being mindful of confidentiality issues, plain language statements were developed. These statements explained the audit objectives, limitations and provided contact details for the auditor. In addition, a letter outlining the audit objectives of the NSW Government's approach to waste management and benefits to the businesses and waste operators was provided.

Each potentially eligible business was then contacted by telephone to provide more detail and to screen out any that did not meet the participation criteria (e.g., sector, size, location to meet SMA/ERA 80:20 involvement or seasonality issues).

Small businesses that were employers of less than five staff were excluded. This was screened during the recruitment process.

During the recruitment process, a questionnaire was used that guided the recruiter to obtain information on:

- Contact details (including location)
- EFTE (or no. of full and part time staff)
- Operating Hours
- System Collection Days/Times

This information was logged on a spreadsheet to assist with scheduling of days for site visits. Scheduling of the small and medium business required more work to ensure there was efficiency in conducting the audits. The large businesses were less in number and thus easier to recruit.

For some sites, depending on the waste system(s) and collection schedules, auditors had to make several visits to observe waste materials as they “build up” in the containers. This enabled a more accurate profile of the types and quantities of materials being disposed.

As detailed below in the “waste assessment” section, details of the businesses requiring off-site analysis of compactors and sealed containers were provided to the auditor to schedule visual assessment such containers off-site.

2.2.3 Preliminary data gathering

Following preliminary agreement with the businesses is reached to participate in this project, a questionnaire was prepared and forwarded requesting some preliminary information (the plain language statement and EPA letter were forwarded at the same time).

- Location
- Number of employees (EFTE) – primarily for confirming eligibility
- Waste systems (e.g., types of materials collected, accessibility, sharing with other businesses)
- Estimated quantities of wastes/recyclables generated per stream
- Collection schedules (i.e., days and frequencies)
- Contractor details
- Seasonality issues
- Operating hours, staff numbers

Businesses were requested to complete and return this questionnaire via email and help schedule of the waste assessment. In addition, this preliminary information supplied was used as a starting point for preparation of the individual site report.

2.2.4 Waste assessment process including visual assessment of compactors

A ‘waste assessment’ is a visual observation of the materials that have been deposited into the waste and recycling containers coupled with determination of other related information such as systems, volumes collected per annum and other aspects related to the existing waste management system(s).

It was planned that the waste audit was scheduled at an appropriate time so that the waste/recycling containers were not serviced by the contractor and ideally just before collection. As noted above, in some cases a number of visits were scheduled to the site to develop a profile of the materials in each stream as the containers are filled.

The steps involved in the waste assessment task are as follows:

1. Review of data/information provided by the businesses prior to conducting the waste audit so as to identify gaps and to develop a process for collecting the data/information while on-site
2. Conduct a site review of waste, systems and storage areas (and other areas where waste containers are located). This is conducted by:
 - a. Visually assessing the materials in the waste/recycling containers as to type of material, density (material categories as a minimum would be those listed in Appendix 4), and whether the material is wet or dry as this impacts the density calculations
 - b. When it was safe to do so, observed garbage bags were cut open to ascertain contents as per point (i) above – this information was recorded separately so as to be able to provide data on composition of garbage bags
 - c. Recording any ancillary information as to the manner in which materials were presented, where the materials appear to have been generated and whether the materials appeared to be raw materials or otherwise
 - d. Reviewing effectiveness of correct segregation
3. Ensure the density conversion factors used are accurate for the type of material for the business type.

4. Identify issues (e.g., bin placement, signage), that could impact on the successful implementation of programs to increase diversion of materials from disposal to landfill.
5. If required hold additional discussions with appropriate staff to clarify any issues and to assist in the development of practical recommendations for improving landfill diversion.
6. Record all data/information on the prepared data forms and then inputting this into the spreadsheet.
7. Calculating annualised quantities of wastes/recyclables per material category based on criteria such as operating hours, waste generating timeframes, density conversion data and benchmarking units.

During this waste assessment, any issues that were noted in regards to correct segregation were brought to the attention of the site contact so that they could be remedied. This includes the removal of materials from bins/streams that should not be present (e.g., clinical waste in a general waste bin, or general waste in a recycling bin etc.). WHS processes were also developed and included in the work plan for management of these issues.

Where the business uses compactors or other types of containers that are “sealed”, visual assessment was addressed by conducting a visual observation of such container as the contents are deposited at the disposal site (i.e., landfill or transfer station). This involved liaison with the transporter and disposal site to ensure that permission was obtained and that any site specific WHS issues were managed (which will be incorporated into the work plan).

The process for this was to gain permission to accompany the container with the contractor as well as access to the disposal site so as to observe the emptying of the containers. By accompanying the contractor, the auditor would be in a position to conduct the process more efficiently, manage WHS issues more effectively and ensure the correct container is visually audited.

As a component of the waste audits, auditors looked for and recorded, all observed opportunities for improving waste management based on avoiding waste generation and improving landfill diversion. This aspect of the project also included discussions with relevant business personnel.

To assist in this process a waste assessment form was used and an example of this is contained in Appendix 5.

2.2.5 Data/information follow up and individual site report preparation

Following the waste assessment, information required to (e.g. invoices, waste reports/audits where available), more accurately record waste volumes and composition was requested from the businesses via email and if necessary by follow up telephone calls. This was designed to improve the quality of data collected but with limited success.

All data on waste volume composition was entered into an Excel spreadsheet for analysis. This spreadsheet enabled conversion of individual material data according to density, wet/dry and compaction level. Refer Appendix 6 for a listing of the waste density factors used.

As part of the agreement reached with the businesses to participate, Waste Audit and Consultancy Services prepared a summary report to each business. This report contained:

- A brief summary of the business
- Demographic information
- Overview of systems
- Composition of general waste and recycling on site
- Summary of opportunities for improved recycling

A sample of the summary report is attached in Appendix 3. The business names and address details in the sample report are fictitious.

2.2.6 WHS management

A full risk assessment of the procedures necessary for this specific project was undertaken to ensure that all risks were understood and appropriately managed. Discussions were conducted with participating businesses to determine if there were any “site specific” additional WHS requirements. These were then incorporated into the WHS plan. At all times site specific requirements in conjunction with safe working practices were addressed (e.g., inductions and use of Personal Protective Equipment – PPE)).

In the first instance, a project WHS plan was developed by the auditor and submitted to EPA for provisional approval. Then following the recruitment process the WHS plan was finalised to ensure it incorporated any business specific issues and management approaches. Refer Appendix 7 for a copy of the plan.

2.3 Division/Sub-divisions analysed

The design of this audit defined the sample size based on a mix of business sizes, ANZSIC division and subdivision and location as to SMA, ERA and regional organisation of council areas.

There was for some divisions a further split between subdivisions with the audit design detailing the percentage breakdown of businesses within this split to be included in the audit. The ANZSIC divisions and subdivision split is detailed in the following table (with the split indicated as a percentage of businesses to be included);

Table 18: GSA audit allocation of ANZSIC Divisions and Subdivisions as determined by EPA

ANZSIC division
C-MANUFACTURING
C11–Food Product Manufacturing (50%)
C-Other remaining subdivisions (50%)
F-WHOLESALE TRADE
G-RETAIL TRADE
G41–Food Retailing (25%)
G42–Other Store-Based Retailing (75%)
H-ACCOMMODATION AND FOOD SERVICES
H44–Accommodation (25%)
H45–Food and Beverage Services (75%)
I-O-OFFICE BASED
I–Transport postal and warehousing
J–Information media and telecommunications
K–Financial and insurance services
L–Rental, hiring and real estate services
M–Professional, scientific & technical services
N–Administrative and support services
O–Public administration and safety
P–EDUCATION AND TRAINING
Q–HEALTH CARE AND SOCIAL ASSISTANCE
R–ARTS AND RECREATION SERVICES

While the total target sample size was 250 businesses, there was a further breakdown of sites audited - 80% of the businesses by division and size) to be audited within the SMA and the remaining 20% within the ERA. The following table illustrates the required number of businesses targeted across SMA and ERA.

Table 19: Allocation of businesses by size and ANZSIC Divisions.

ANZSIC division	Business size			Totals
	Small	Medium	Large	
C-Manufacturing (50% C11)	15	15	6	35
F–Wholesale Trade (F33–F38)	10	10	5	25
G–Retail Trade (25% G41 and 75% G42)	10	10	5	25
H–Accommodation and Food Services (25% H44 and 75% H45)	16	14	10	40
I–Transport, Postal and Warehousing	15	5	2	22
J–O (office based industries)	50	10	7	67
P–Education and Training	5	3	2	10
Q–Health Care and Social Assistance (Q84–Q87)	8	5	3	16
R–Arts and Recreation Services (R89–R92)	5	2	2	10
Totals	134	74	42	250

Those businesses approached were initially allocated to three business size ranges in terms of Equivalent Full-time Employees (EFTE) size brackets, which are:

- 5–19 (small)
- 20–199 (medium)
- 200+ (large)
- EPA required that non-employing businesses were to be excluded from the audit scope.

3. Results – Key findings

This Section provides a summary of the key findings from the GSA. Refer Appendix 2 for detailed data per ANZSIC division (and where applicable sub-division), and by region.

3.1 Number of waste assessments conducted per industry division/sub-division, area and region

The following tables demonstrate the numbers of waste assessments that were conducted in totality as well as by size of the business and location (SMA/ERA and/or Region). The size of the business is also represented as per Small, Medium and Large (based on employment numbers). As illustrated, 197 businesses were assessed with the split being 73% SMA and 27% ERA.

3.2 Overall composition of C&I waste streams by small/medium/large per Division/Sub-division

In total, 78,947 tonnes of C&I waste was reported as being generated for all **audited businesses** within all areas per annum.

As illustrated in **Table 33**, based on the data gathered from the waste assessments, and for all areas, the Medium sized businesses generated the greater percentage of C&I waste (70.5%) followed by the Large businesses (27.1%) and then Small (2.4%).

As demonstrated in **Table 35**, in SMA, medium sized businesses generated the greater percentage of C&I waste (76.5%), with the large businesses in ERA generating the greater percentage (73.1%).

What the data demonstrates is that no specific area should be targeted for actions to improve landfill diversion. Different ANZSIC divisions/sub-divisions have varied opportunities within each area and also in relation to the size of the business.

- Tables 33 to 42 provide the tonnages of C&I waste by ANZSIC division and sub-division per area and region
- Tables 43 to 49 provide the tonnages of C&I waste by streams per area and region
- Tables 50 and 51 provide the C&I general waste tonnes by area and region
- Tables 52 to 58 provide the tonnages of C&I waste by streams by ANZSIC division per area and region

3.2.2 Total Tonnes of C&I Waste by streams per Areas and Regions

It has been concluded from the analysis of the data gathered during this project, that no specific Area, Divisions, Business (type and/or size), should be targeted for actions – however the information provided in the following Tables provides the type of information that can be used to develop strategies for improved diversion of materials. Note that for some Regional Groups the sample size is limited and as such due to the low number of businesses audited and the concern in the validity of the data for the MACROC, SHOROC and Southern Councils Group these were excluded from the analysis below.

3.4 Issues with data such as conversion of volume to weight

No issues were identified with the data conversions apart from when using data from participating businesses (e.g., invoices showing historical volumes, waste report where available). As data for this project was gathered through visual assessment of the waste stream, potentially not all wastes may have not been identified.

In conjunction with the use of density factors identified in the audit design, use of historical data and comparisons with other similar businesses was undertaken to ensure that the conversion of volume to weight was as accurate as possible. This also necessitated an understanding of degree of compaction and whether waste was wet or dry.

3.5 Current systems for general waste and recyclables per Division/Sub-division

Based on the waste assessments conducted at the participating sites, the conclusion is that there is no consistency or pattern as to the systems that have been implemented for the various ANZSIC Divisions and Sub-divisions. For example, it cannot be said that all manufacturing businesses use compactors for general waste.

The main types of waste management systems used are:

- General Waste – Compactors, bins (ranging from 1.5m³ to 4.5m³) and 240 litre Mobile Garbage Bin (MGB)
- Cardboard/paper – 3m³ bins, compactors and balers
- Paper only systems – 240 litre MGB
- Comingled – 240 litre MGB
- Glass – 240/120 litre MGB
- Organics – 120 litre MGB
- Metals – open bins (skips)
- Soft plastic – 240 litre MGB, balers

The provision of waste/recycling management systems is dependent on the following factors:

- Area or region where the business is located
- Contractor provided equipment and availability of that equipment
- Quantities of materials generated
- Availability of diversion systems
- Costs of systems
- Collection frequencies
- Available space for bins and access for collection vehicles (including such issues as overhead wires or other similar issues)

The only conclusion that could be made about systems is that in the main, observed systems were functioning efficiently – both for the management of materials and being cost-effective for the business generating the materials.

The following table summarises the types of systems commonly used within each of the ANZSIC Divisions for both general waste and recyclables. Based on the factors listed above that influence the choice of systems, different businesses within the same division will have systems that meet their individual requirements. These factors must be recognised when advocating management approaches for increased recycling.

Table 111: Types of systems commonly used within ANZSIC divisions

ANZSIC Division	Stream		Typical System Limitations
	General Waste	Recycling	
C11 - Food Product Manufacturing	Compactors Front lift bins	Compactors Front lift bins Open bins MGB	Available space Costs of systems Availability of systems
Other Manufacturing	Compactors Front lift bins	Compactors Front lift bins Open bins	Available space Costs of systems Availability of systems
F - Wholesale Trade	Front lift bins	Front lift bins MGB	Available space Costs of systems Availability of systems
G41 - Food Retailing	Front lift bins	Front lift bins MGB	Available space Costs of systems Availability of systems
G42 - Other Store-Based Retailing	Front lift bins MGB	Compactors Front lift bins MGB Balers	Available space Costs of systems
H44 - Accommodation	Compactors Front lift bins MGB	Compactors Front lift bins MGB Balers	Available space Costs of systems
H45 - Food and Beverage Services	Front lift bins MGB	Front lift bins MGB Balers	Available space Costs of systems
I - Transport, Postal and Warehousing	Front lift bins MGB	Front lift bins MGB	Costs of systems
J-O - Office Based Industries	Front lift bins MGB	Front lift bins MGB	Available space
P - Education and Training	Front lift bins MGB	Front lift bins MGB	Costs of systems
Q - Health Care and Social Assistance	Compactors Front lift bins MGB	Compactors Front lift bins MGB Balers	Available space Costs of systems Availability of systems
R - Arts and Recreation Services	Front lift bins MGB	Front lift bins MGB	Available space Costs of systems

3.6 Bulk densities for the specific materials

This included determination of bulk densities for the following segregated material types stored in containers on site:

1. General waste
2. Paper
3. Cardboard
4. Glass bottles and jars
5. Cans – ferrous and non-ferrous
6. EPS or other plastics
7. Co-mingled recyclables

The determination of bulk densities was limited to what is stored in MGB that could be weighed on-site. In addition, where practical, some of the density factors (as contained in Appendix 7), were validated (e.g., for mattresses and metal (loose and compacted)).

The density conversion factors in Schedule 7 had been collected over a significant timeframe, and had wide acceptance in regards to its accuracy. The following table contains the additional bulk densities determined.

Table 112: Bulk density data

Stream	Density kg/m ³
Cardboard	48.75
Comingled	61.96
General Waste	80.38
Glass	179.51
Organics	321.06
Paper	71.81
Secure Paper	154.09

The raw data for the bulk densities can be found in Appendix 2.

In using these bulk densities, it should be noted that the methodology used had the following limitations::

- The data was collected just from MGB
- This MGB density data is on a smaller sample size
- The data does not include all ANZSIC Divisions
- Information as to “degree of fill” of the MGB as well as compaction rates (or wet/dry materials), was not always available
- None of the mobile garbage bins weighed included cans only or EPS/other plastic materials only.

Table 113 compares Bulk density and Density Conversion Factors included in the NSW Government's Waste Reduction and Purchasing Policy (WRAPP) Guidelines.

Table 113: Bulk density data

Stream	GSA Density kg/m ³	WRAPP Density
Cardboard	48.75	50
Comingled	61.96	17
General Waste	80.38	-
Glass	179.51	-
Organics	321.06	-
Paper	71.81	240
Secure Paper	154.09	-

3.7 Benchmarking

Benchmarking in this report refers to waste generation per floor area, number of employees, meals served or beds in use depending on the type of business assessed.

The benchmarking measure differ for the different industry divisions and sub-divisions. For example occupied square metres is often used for office based businesses whereas units of production for manufacturing. An occupied bed day is used in hospitals where EFTE is not appropriate, but this latter unit is suitable for other service based businesses.

There are many factors that may affect waste generation. Some of these include:

- a. Seasonality/month of the year
- b. Day of the week
- c. Different work/production schedules
- d. Staff/Management attitudes
- e. Provision of staff education programs on waste management
- f. Maintenance schedules

When an attempt is made to develop benchmarks for the whole industry division and/or sub-division, the following additional factors should be addressed:

- a. Different work practices
- b. Quality assurance programs/procedures
- c. Number of employees
- d. Age and type of manufacturing equipment
- e. Types of products manufactured
- f. Rate of manufacturing
- g. Different client base
- h. Different raw materials
- i. Implementation of waste management (especially waste diversion/avoidance actions)
- j. Data from contractors if in volume may only represent the volume of the waste container collected – not the actual volume of material at the time of collection

There is also the issue of waste generators (of the same Divisions and/or Sub-divisions) receiving data in different formats. For example the same type of retail store could be charged by weight and a similar one by volume – this then makes conversions to an industry specific unit problematic.

There is no agreement currently within each industry sector as to what “unit” should be used as the basis for calculating benchmarks (e.g., staff numbers, production rates, number of products, income, guests, OBD) – all of these have issues

In this audit EFTE numbers associated with the businesses were used so that the generation rate could be “scaled up” per division and/or sub-division within the SMA and ERA. There are potentially some errors with this approach due to the reliance on businesses to accurately report on EFTE numbers.

There is also the assumption that each part-time employee represents 0.5 EFTE, regardless of actual time fraction employed per employee. This approach is used by ABS.

Table 114: Benchmarking by ANZSIC division

	Average Kg /m ² / Day		
	Total Waste	General Waste	Recycling
C-Manufacturing	0.54	0.09	0.45
F - Wholesale Trade	0.11	0.02	0.08
G - Retail Trade	0.05	0.01	0.04
H - Accommodation and Food Services	0.5	0.23	0.26
I - Transport, Postal and Warehousing	0.04	0.02	0.02
J-O - Office Based Industries	0.02	0.01	0.01
Q - Health Care and Social Assistance	0.23	0.08	0.15

The Education and Training sector is typically benchmarked against the number of students/children and therefore the following benchmark information was obtained.

Table 115: Benchmarking for P-Education and Training

P - Education and Training	Average kg/student/ Day		
	Total Waste	General Waste	Recycling
University A – 2800 students	0.12	0.11	0.015
University B – 4000 students	0.05	0.038	0.010
Primary School A – 115 students	0.03	0.024	0.003
Primary School B – 235 students	0.02	0.007	0.016
Child Care Centre A – 60 children	0.004	0.003	0.001

The raw data for benchmarking can be found in Appendix 2.

The following table compares the benchmarking waste generation rates detailed in the [Better Practice Guidelines for the Waste Management and Recycling in Commercial Buildings](#) with the waste survey benchmarking data for applicable businesses only.

Table 116: Applicable Benchmarking by Business Type in comparison to Better Practice Guidelines for Waste Management and Recycling in Commercial Buildings

Type of premises	Average L per 100m ² per day		Maximum L per 100m ² per day		Number of businesses surveyed	GSA Average L per 100m ² per day		GSA Maximum L per 100m ² per day		GSA Number of businesses surveyed

4. Statistical Analysis of Site-based Waste Audits

The results of the statistical analysis of the waste audit data from the site-based waste audits conducted as part of this study are presented in this section.

The data set is comprehensive. However, as the nature of waste generated by businesses varies considerably, there are still limitations on the accuracy of the results. Further, the use of visual assessments to collect data on waste composition introduces an inherent inaccuracy.

As per the project brief, the waste audit results are presented on a per FTE basis. It was also a requirement of the project brief to present the “non-normal” nature of the data, which is presented in each section below.

The following analyses are presented for each ANZSIC Division, as well as for all ANZSIC codes:

- Correlation between total waste generation and FTE
- Average total waste generation
- Median total waste generation
- Standard deviation
- 90% confidence intervals
- Standard error around the mean.

This basic analysis should allow most users to assess whether the data presented in this report is suitable for their purposes. However, some further analysis may be required for specific uses. It should be noted that large variances are not unusual in waste categorisation.

As will be discussed further below, the probability distribution for this data is not a normal distribution. However, as the sample size is well over 30 sample points, the use of confidence interval equation is still valid. The question arises as to what is the most appropriate estimate for the “expected value”, which is usually estimated by the average for a normally-distributed population. The average and the median of the sample set have been provided in the tables below as an indicator of how skewed the data is.

4.1 Total waste audited – All ANZSIC Codes

The following analyses were performed on data from all businesses audited for which an estimate for FTE was available at the time of the analysis. In total, this includes 194 businesses. For the analysis presented this section, no outliers were removed.

Table 117: Total waste generation by ANZSIC Division (tpa)

ANZSIC Division	Count (n)	Total waste generation (tpa)	MAX (tpa)	MIN (tpa)	Correlation Coefficient between total waste generated and FTE (R)
C - Manufacturing	37	37,466.07	12,941.53	0.29	0.28
F - Wholesale Trade	19	24,448.56	22,797.5	0.9	0.56
G - Retail Trade	33	1520.86	164.56	0.76	0.64
H - Accommodation and Food Services	18	6843.18	3047	6.1	0.85
I - Transport, Postal and Warehousing	18	2011.95	732.3	0.4	0.97
J-O - Office Based Industries	30	1607.39	638.1	0.7	0.95
P - Education and Training	11	358.8	119.7	1.5	0.41
Q - Health Care and Social Assistance	14	2877.24	1066.3	1.48	0.92
R - Arts and Recreation Services	14	18.56	3.45	2	0
All ANZSIC codes	194	78,947.91	22,797.5	0.13	4

Table 118 shows summary data for total waste generation by businesses per FTE for each ANZSIC Division. It should be noted that the correlation between total waste generation and FTE was calculated to be five, indicating a very low correlation between the two variables. Therefore, the “per FTE” figures need to be used with caution.

Table 118: Total waste per FTE by ANZSIC Division (t/yr/FTE)

ANZSIC Division	Count (n)	Total (tpa)	Average	Median	STD DEV	MAX	MIN	90% CI	Upper 90% CL	Lower 90% CL	Standard error	error around mean

4.1.1 Probability distribution

Despite the large sample size, the probability distribution for the data is highly skewed, indicating that the population does not follow a normal distribution. The frequency histogram was fitted against a Poisson distribution and an Exponential distribution. The best fit was found using the method of least squares. The results are presented in Figure 19. The best fit expected value for the Poisson distribution was 0.54 tpa. The best fit expected value for the Exponential distribution was 0.78 tpa. The Exponential function achieved the best fit to the sample frequency data.

Figure 19: Probability density function for total waste generated per FTE for all ANZSIC Divisions

4.2 C – Manufacturing

Despite the large sample size for this Division, the skew in the data and the large variability between different types of manufacturing processes means that the data is unreliable for predicting waste generation. As shown in Table 121, the correlation between waste generation and FTE is very low. This means that FTE is a poor basis for predicting waste generation at the ANZSIC Division level.

It is probably more appropriate to break down the sample into ANZSIC sub-Divisions or even finer classifications, due to the disparate nature of manufacturing activities. However, this would require a much larger sample size.

Table 121: Total material categories for C – Manufacturing (tpa)

4.2.1 Probability distribution

The expected value derived from fitting the Poisson distribution was 1.3. The expected value derived from fitting the Exponential distribution was 0.3. The Exponential distribution achieved the best fit.

Figure 20: Probability density function for total waste generated per FTE for C – Manufacturing

4.3 F – Wholesale Trade

The correlation between waste generation and FTE is low for Wholesale Trade at the ANZSIC level. The variance in the waste generation observed in this sample is very high. The data set appears to be highly skewed, making determining an “expected value” difficult. Therefore, it is likely to be unreliable for predicting waste generation for this sector at this high level.

Table 123: Total material categories for F - Wholesale (tpa)

Material Category	Count (n)	Total waste generation	MAX	MIN	Correlation Coefficient between total waste generated and FTE (R)	% of waste stream

The expected value derived from the Poisson distribution was 0.4. The expected value derived from the Exponential distribution was 1.02. The Exponential distribution achieved the best fit.

Figure 21: Probability density function for total waste generated per FTE for F - Wholesale

4.4 G – Retail Trade

As expected, due to the highly variable nature of the retail trade, the correlation between waste generation and FTE is low at the ANSIC Division level. The correlation is very low for material categories, which is expected due to different types of retailers generating different types of waste.

Table 125: Total material categories for G – Retail (tpa)

4.4.1 Probability distribution

The expected value for total waste generation per FTE derived from the Poisson distribution was 0.58. The expected value derived from the Exponential distribution was 0.81. The Poisson distribution achieved the best fit.

Figure 22: Probability density function for total waste generated per FTE for G – Retail

4.5 H – Accommodation and Food Services

There is a relatively good correlation between total waste generation and FTE for this ANZSIC Division. There is even good correlation between FTE and generation of some material categories. The error and variation for this Division is relatively low for total waste generation and for the major material categories, such as cardboard, organics and glass.

Table 127: Total material categories for H - Accommodation and Food Services (tpa)

4.5.1 Probability distribution

The frequency histogram for this Division was fitted against the Poisson distribution, Exponential distribution and Normal distribution. The Exponential and Normal distributions achieved the best fits, but only slightly. The expected value derived from the Poisson distribution was 2.8. The expected value derived from the Exponential distribution was 0.2. The normal distribution was fitted around an estimated mean and the standard deviation calculated for the sample (fitted mean = 2.4, standard deviation = 2.73), which achieved a better fit than using the calculated average as the mean.

The expected value derived from the Poisson distribution was 0.7. The expected value derived from the Exponential distribution was 0.8. The Exponential distribution achieved the best fit.

Figure 24: Probability density function for total waste generated per FTE for I - Transport, Postal and Warehousing

4.7 J–O – Office Based Industries

As might be expected, this group of Divisions show a strong correlation between waste generation and FTE. There is still quite a bit of variation in the sample data. Therefore, the linear regression equation may be useful for predicting waste generation ($y = 0.1085x + 2.9872$; y = total waste generation and x =FTE).

Table 131: Total material categories for J–O – Office Based Industries (tpa)

4.7.1 Probability distribution

The expected value derived from the Poisson distribution was 0.1. The expected value derived from the Exponential distribution was 2.1. The normal distribution was fitted around an estimated mean and the standard deviation calculated for the sample (fitted mean = 0.5, standard deviation = 0.33), which achieved a better fit than using the calculated average as the mean. The Poisson distribution achieved the best fit, followed by the normal distribution.

Figure 25: Probability density function for total waste generated per FTE for J-O - Office Based Industries

4.8 P – Education and Training

The correlation between waste generation and FTE in this Division is low, which reflects the highly variable nature of the businesses within this Division. The variation is quite high, but this may be more a reflection of the small sample size for this Division.

4.8.1 Probability distribution

The expected value derived from the Poisson distribution was 0.23. The expected value derived from the Exponential distribution was 1.6. The Poisson distribution achieved the best fit.

Figure 26: Probability density function for total waste generated per FTE for P - Education and Training

4.9 Q – Health Care and Social Assistance

The correlation between total waste generation and FTE is high for this sample. Therefore, the linear regression equation may be useful in predicting waste generation for this Division ($y = 1.0874x + 14.679$; y = total waste generation and x =FTE). The error and variation on the total waste generation are relatively low, considering the sample size.

Table 135: Total material categories for Q – Health Care and Social Assistance (tpa)

Figure 27: Probability density function for total waste generated per FTE for Q - Health Care and Social Assistance

4.10 R – Arts and Recreation Services

The correlation between waste generation and FTE is quite weak, indicating that FTE may not be a good basis for prediction at the Division level. The variation is relatively low considering the small sample size and the diverse nature of businesses audited.

Table 137: Total material categories for R – Arts and Recreation Services (tpa)

The expected value derived from the Poisson distribution was 0.9. The expected value derived from the Exponential distribution was 0.6. The Exponential distribution achieved the best fit.

Figure 28: Probability density function for total waste generated per FTE for R - Arts and Recreation Services

4.11 Discussion and Recommendations

Waste generation in the C&I sector is affected by a wide range of factors, such as the nature of the business and individual business practices. This means that waste generation in the C&I sector is highly variable in both amount and composition. The variation in waste data is compounded by the difficulties in collecting accurate data from this sector, as discussed elsewhere in this report. Therefore, a high degree of variation is to be expected.

Another difficulty is that the data is non-normal in its distribution, making the use of the usual parametric methods of analysis problematic. However, the relatively low sample size means that analysis by non-parametric methods is not appropriate for data at the Division or Sub-Division level.

Nevertheless, the data set developed from 194 generator site-based audit of businesses is a valuable resource for developing evidence-based policy and programs for the NSW Government and to the businesses and waste industry to identify opportunities for more recycling. The users however need to be aware of the variation in the data and take that into account when applying the key findings to suit particular circumstance. .

The best way to improve the accuracy of and confidence in the data is to increase the sample size; preferably to a size that allows analysis at the sub-division level. It may be useful if this data is reviewed against data collected from other site-based waste audits (such as those conducted as part of the BinTrim program or from other jurisdictions) to achieve a good outcome.

5. Comment on specific issues and/or materials

5.1 Materials recoverable

The generator site-based audit found diversion of waste from landfill being affected by various issues associated with the systems, management approaches and material types, including (not in any specific order):

- While many personnel had good knowledge of waste management systems (in terms of what materials could be diverted and what other businesses are doing), they often were restricted by production issues, operational concerns, cost factors and the constraints due to the business' location.
- There was some innovation in terms of types of systems being implemented (e.g., organics systems) and for some sites in ERA material exchanges had been organised that resulted in decreased levels of waste to landfill.
- Based on audits that had been undertaken in previous years at similar businesses, the auditor found improvement in landfill diversion actions within the small sized businesses. Specifically an increase in uptake of diversion systems for materials such as cardboard and comingled, with the levels of low contamination observed.
- Within local government there are good and consistent systems across the council for diversion (bin types, colours and signage).
- For small and medium sized businesses, cost issues for the various diversion systems is important as to the adoption of such systems.
- A variety of management systems (i.e. container types/sizes) are in use for similar materials in the same division. While not an issue in itself, it shows that there is a need for ensuring that systems meet the needs of individual businesses.
- Timber seemed to be a large issue with many sites generating it, but few actually having systems to divert it from landfill. Part of the issue was due to contamination (i.e., the timber may have a nail or bolt attached), and it was labour intensive to manage these contaminants.
- Lack of some recycling systems in ERA and/or higher costs associated with the provision of such systems.
- Materials that can be recycled in SMA, but difficult to obtain services that are cost-effective in ERA are soft plastics, polystyrene and mattresses
- Though there is willingness to separate and transport compacted materials (e.g. polystyrene) to improve diversion rates, provision of necessary infrastructure could be cost-prohibitive and not practical.
- Divertible materials such as cardboard/soft plastic are being disposed of into general waste because of lack of space for recycling bin or lack of action to implement (e.g., within the warehouse/wholesaler Divisions).
- Businesses with multiple sites could have different waste management systems resulting in varied levels of recycling. This may occur due to lack of oversight of systems, availability of systems within locations and costs management issues.
- For some businesses when waste management is under a national contract, site specific and/or location specific issued would affect potential recycling
- Limitations within existing contract to divert and implement new systems – such as with new technology or targets established by the head contract
- Contractor not providing advice on potentially recoverable streams. The contractor may offer a diversion system to a similar business, but not for another or provided advice on diversion opportunities that would be cost effective.
- Contamination of recyclables due to site practices. For example, the recycling bin for specific streams is not located in the optimum place due to internal issues (e.g., production locations, need to transport goods internally, staff preferences, shifts in activities) and as a result there is poor "at source" segregation.
- Information not being provided to staff on potential for segregation and as such contamination occurs. This could be due to lack of, wrong signage or incorrect colour coding of bins.

- With small businesses there was often a lack of knowledge of the types/quantities of materials being generated and management pathways. There is often a reliance on cleaners to ensure materials are correctly managed.
- There appears to be little on-going monitoring of systems (i.e., to measure leakage or contamination), where staff are depositing materials, changes in materials generated and other staff/cleaners practices that impact on correct waste management.
- Stock monitoring for perishable and redundant damaged products (e.g., no market so disposed of), was an issue for small and some medium sized businesses.
- There was some innovation in terms of types of systems being implemented (e.g. organics systems) and, for some sites in the ERA, material exchanges had been organised that resulted in decreased levels of waste to landfill.

6. Conclusions

There were challenges in recruiting businesses to participate in this audit as well as obtaining all necessary data/information from all business in a timely manner. However strategies were implemented to overcome these issues.

Importantly, the GSA process identified the types of systems currently in use within the targeted ANZSIC Divisions/Sub-divisions as well as other waste management related factors. This has been summarised within Section 3.5. In addition, individual site reports detail the types of systems and other management aspects. It was found that there is a diversity of systems within Divisions for the reasons as detailed in Section 3.5.

To ensure sustainable and cost-effective management of materials at the business level as well as to promote improvements that will lead to waste reductions and increased landfill diversion, data on generation rates is not sufficient.

As demonstrated though this audit, having a detailed understanding of existing limitations within the various businesses for improvements coupled with information on what is required to assist adoption of improved activities is paramount to achieve sound resource recovery outcomes in New South Wales.

The results from the GSA indicated that:

- There is no specific pattern for waste generation rates (tonnages), for the different divisions and different areas for the various sized businesses. This demonstrates that any actions to improve landfill diversion rates should be targeting all material types audited.
- The data demonstrates that no specific region should be targeted for actions to improve landfill diversion as there are opportunities within each region and industry divisions. Different ANZSIC Divisions/Sub-divisions have varied improvement opportunities within each Area and also in relation to the size of the business.
- There are a diverse range of waste management systems in the SMA and ERA for the same business type(s) and size(s).
- There is significant opportunity to increase landfill diversion for a variety of materials from all divisions/sub-divisions in all areas.
- More cost-effective recycling systems need to be provided in the ERA.
- Many materials are not being diverted due to businesses not viewing waste management as a core activity and not having resources (particularly time), to investigate alternative management approaches.
- Cost is a major inhibiting factor for implementation of diversion systems coupled with the availability of systems in the ERA.
- Overall, businesses are supportive of implementing opportunities for improved landfill diversion, but require access to cost-effective services and information on implementation strategies.
- The availability of space on site plays a significant factor as to the variety of management systems implemented for many businesses (particularly for small and medium size businesses).
- Waste management education is not being conducted effectively for many different sized divisions/sub-divisions across all Areas.

In regards to data from the GSA audits:

- 197 sites participated in this project which was 78.8% of the target number of sites. Of these 73% of the sites were located in the SMA and 27% in ERA.
- 78,947 tonnes per annum of waste were recorded as being generated for all businesses audited for all areas.
- The audited ANZSIC divisions/sub-divisions general waste streams represent 33.1% by weight with materials currently diverted representing 66.9% for all areas. A similar percentage relates to the SMA (32% and 68% respectively, but with a lower rate of currently diverted material in the ERA (57.5%).
- Medium sized businesses generated the greater percentage of C&I waste (70.5%) followed by the Large businesses (27.1%) and then Small (2.4%).
- In the SMA, medium sized businesses generated the greater percentage of C&I waste (76.5%), with the large businesses in ERA generating the greater percentage (73.1%).

A number of issues have been identified (and summarised within the Executive Summary), as to the reasons for not achieving the required number of businesses audited. As a result, statistical analysis for under-represented divisions/size of business helps to identify reliable data for some high level ANZSIC Divisions and materials.

The data analysed for the divisions. Size of businesses and regions are still included in this report in the Appendices for completeness. This data with limited statistical confidence should be treated with utmost caution.

A larger sample of businesses from the key ANZSIC Divisions, business sizes and regions will need to be undertaken to obtain data with an acceptable statistical confidence. But such an audit could be cost prohibitive

7. Recommendations

7.1 Future actions to enhance landfill diversion

Based on the generator site audit undertaken in 2014, this report recommends the following actions to increase recycling at business premises:.

1. Share the key findings of this audit with businesses, local councils and the waste and resource recovery industry
2. Continue to provide advice to business on opportunities within their Local Government Area to divert materials, such as with the Bin Trim program and those provided by other organisations
3. .
4. Encourage local government to establish material exchange systems
5. Assist ERA businesses to implement landfill diversion for materials such as timber.
6. Avoid scheduling large audits of this type concurrently with other programs such as Bin Trim to maximise business participation
7. .
8. Education of staff is paramount and practical resources need to be developed (e.g., scripts for toolbox meetings).
9. Monitoring and reporting actions (e.g., WRAPP resources) made more readily available and promoted.
10. Promote the need for and provide tools to assist businesses undertake due diligence in regards to where materials are being transported to. All Businesses must have a good understanding as to what contractors are doing (i.e., specifically for food manufacturing where contractors change disposal locations and do not advise clients).
11. Promote use of standard signage and colour coding of waste/recycling containers as well as inform of different options for management systems.
12. Liaise with industry associations to discuss how materials can be better managed at the industry level

7.2 Infrastructure/resource issues – SMA/ERA

1. Review the provision of recycling infrastructure within all Areas/Regions. As a first stage, undertake a stocktake to identify gaps in infrastructure in the Areas/Regions and relate this back to data from these audits so as to convey to service providers the potential for expanding recycling services.
2. Examine the potential for implementing consolidated systems for industrial parks. For example provision of balers, or bins for businesses that have limited space and even waste exchange systems.
3. Offer grants to businesses/cluster of businesses to install equipment that would enhance diversion such as balers for cardboard and plastics.

8. Appendices

Appendix 2: Pro forma site specific report

Any representation, statement, opinion or advice, expressed or implied in this publication is made in good faith, but on the basis that NSW EPA and APC, Waste Audit are not liable (whether by reason of negligence, lack of care or otherwise) to any person for any damage or loss whatsoever, which has occurred or may occur in relation to that person taking or not taking (as the case may be) action in respect to any representation, statement or advice referred to here.

The data collected from each site will be kept confidential and only aggregated data for the SMA, ERA will be published.

1. Background

As part of the Waste and Recycling Infrastructure Fund, the NSW EPA is undertaking an audit of the Commercial & Industrial (C&I) stream to determine the composition by selected material categories and subcategories with a particular focus on materials potentially recoverable, industry sectors that are generating the most C&I Waste regions and sub-regions within the Sydney Metropolitan Area (SMA), Extended Regulated Area (ERA) and the Regional Regulated Area (RRA).

A key focus of the C&I audit methodology is the collection of data about targeted industry divisions and sub-divisions as defined by Australian and New Zealand Standard Industrial Classification (ANZSIC) code.

In order to achieve the above NSW EPA has contracted Waste Audit and Consultancy Services to conduct waste assessments on generator sites to provide information specific to waste systems, management practices, and areas for improved diversion and waste minimisation.

2. Site Description and Demographics

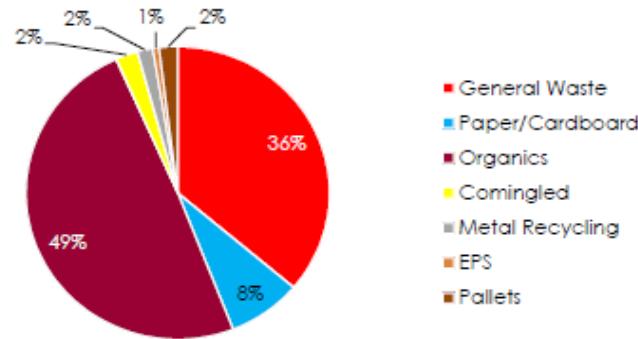

Site Name	ACME Industry	Site Contact Name	John Smith
Site Address	210 Balmain Rd Lilyfield NSW 2040	Site Contact Role	Sustainability Manager - 02 9285 9000
Operating Hours	Sunday Evening 11pm with Night Shift and then shutdown occurs on Saturday afternoon. 3 shifts operate during the week as follows: day shift: 6am or 7am – 2pm or 3pm; Afternoon shift 3pm -11pm; Night Shift 11pm – 7am.	ANZSIC Division	C - Manufacturing
		ANZSIC Subdivision	C11 - Food Product Manufacturing
EFT	110	Area	Sydney Metropolitan Area (SMA)
Business Size	Medium - 20 - 199 EFT	Benchmarking Data	1250 sqm
		Date of review	7th July 2014

NSW EPA - Generator Site Audit - 3

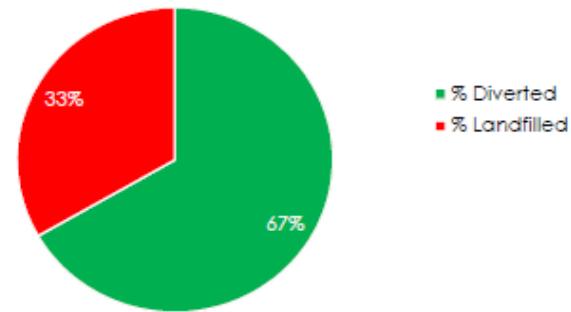

3. Waste Profile and Systems

Streams	Systems in place	Tonnes per Annum	Disposal
General Waste	23M Compactor	550	Landfilled
Paper/Cardboard	20M Compactor	120	Recycled
Organics	26M Skip	750	Recycled
Comingled	10 x 1100L MGB	36	Recycled
Metal Recycling	15M Skip	25	Recycled
EPS	Autobaler	10	Recycled
Pallets	Stockpiled	30	Recycled
Total		1456	

% Diverted 67%
 % Landfilled 33%

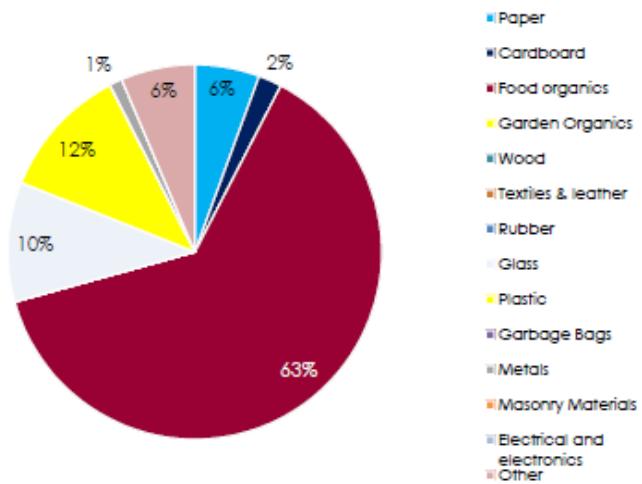

- General Waste
- Paper/Cardboard
- Organics
- Comingled
- Metal Recycling
- EPS
- Pallets

NSW EPA - Generator Site Audit - 4

4. General Waste Composition

	Tonnes	%
Paper	0.03	5.6%
Cardboard	0.009	2.0%
Food organics	0.28	63.1%
Garden Organics	0.00	0.0%
Wood	0.00	0.0%
Textiles & leather	0.00	0.0%
Rubber	0.00	0.0%
Glass	0.05	10.3%
Plastic	0.05	11.5%
Garbage Bags	0.00	0.0%
Metals	0.00	1.1%
Masonry Materials	0.00	0.0%
Electrical and electronics	0.00	0.0%
Other	0.03	6.4%
Total	0.45	100.0%

5. Reasons for the generation of the waste

The major causes of waste are summarised as:

Metal drums from raw materials

Pulp and molasses resulting from juice production

Plastic PET bottles resulting from:

- Not meeting required standards pre-filling
- QA rejection post-filling

Plastic strapping from packaging

Foil from containers with raw materials

Cardboard from:

- Raw material supply
- ACME branded cartons resulting from reject of stock
- Scholle bins - excess stock (some damaged and some excess ordering)

6. Waste Management Information

The primary cause for organic waste is from fruit pulp resulting from manufacture of juice and molasses.
 The site has developed an excellent flowchart for waste generation causality from the various raw material and processes on the site.
 Waste and recyclables generation is recorded on a monthly basis along with associated costs.
 Staff waste management training occurs through toolbox sessions.
 A number of waste avoidance and landfill diversion opportunities have been implemented, but no detail as to the status of investigations for implementing them was available.

7. Assessment

		large/ significant waste issue and potential opportunities for improvement		moderate issue / while some action is in place further opportunities exist		management is appropriate for the materials / not an issue for this organisation
Waste Issue	Rating	Comments	Waste Issue	Rating	Comments	
Food waste		Avoidance is not an option as pulp generated from obtaining juice	Rework/Scrap		There is no rework or scrap.	
Packaging		Significant quantities are disposed of via the general waste stream	Recyclable Materials		Recycling streams need expanding to include more plastic materials.	
Resource Utilisation		production, resource efficiency appears good.	Other Waste		Management of Scholle bins needs urgent review.	

8. Opportunities & Recommendations

Waste Issue	Recommendations
Packaging	Further work needs to be undertaken with suppliers and production staff to quantify each and all reasons for rejection of empty PET bottles prior to filling. Based on this information, appropriate actions be implemented to reduce the wastage. As part of the process, benchmarking of the quantity currently disposed of per "cause" be established and targets for improvement established.
Recyclable Materials	The current waste/recycling contractors be required to provide additional systems for materials (specifically plastic) so that they can be diverted from landfill. Records be maintained for all materials disposed of (waste and recyclables), regardless of whether costs, rebates or free are related to each of the materials.
Other Waste	Scholle Bins - identify potential markets for these bins so that they can be reused (eg., as vegetable gardens for purchase or for donation to charities and schools).

Appendix 3: Project photographs

Photographs were taken of any specific issues noted during the waste assessment (positive and negative). To maintain confidentiality, the name of individual businesses has not been noted. These photographs illustrate common occurrences of materials that could be diverted to landfill and/or impact on effective diversion of materials to landfill.

Photograph 1: Backing paper – significant portion of the general waste for transport/warehousing

Photograph 2: Composite material – bladder used in shipping container not being reused – going to landfill

Photograph 3: Packaging— mix of material – would require additional labour to segregate

Photograph 4: Packaging—mix of material – medical/pharmaceutical packaging – three different type of materials – cardboard & two EPS types which cannot be separated.

Photograph 5: Packaging – medical / pharmaceuticals which are required to be temperature controlled – polyethylene casing which are not returned to sender

Photograph 6: Packaging – medical / pharmaceuticals insulation shipping material – cardboard/plastic and liquid all going to landfill

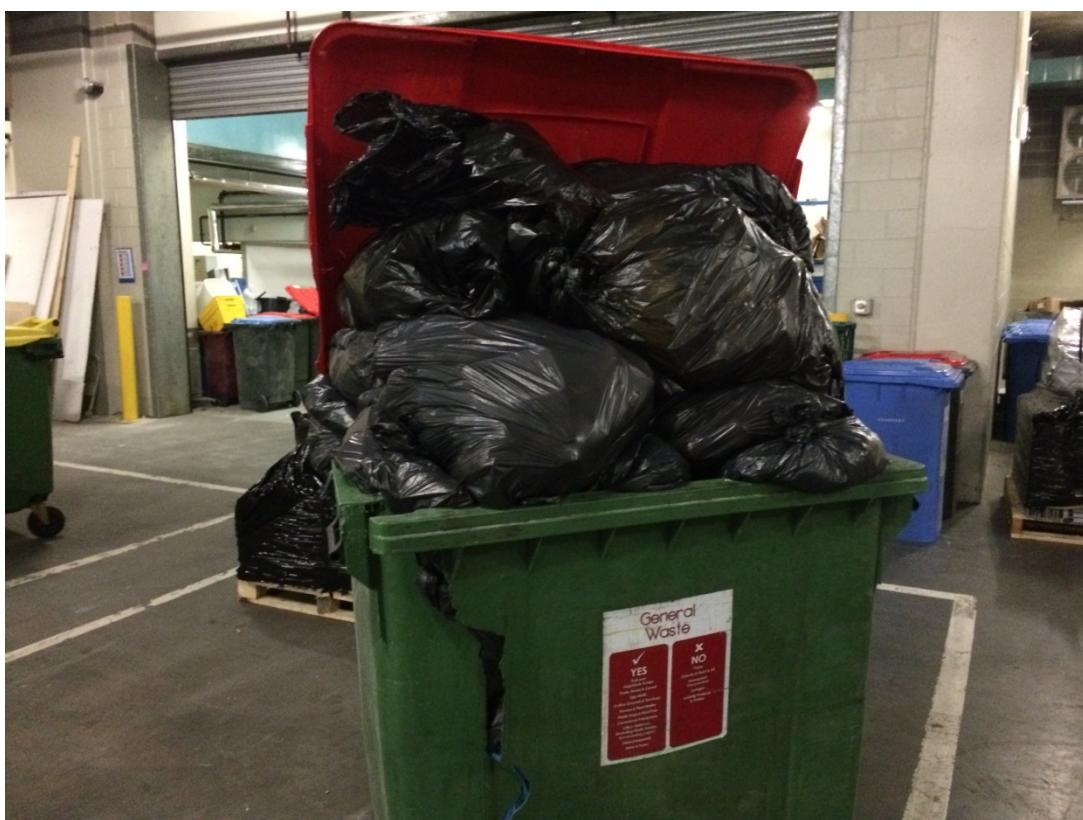

Photograph 7: Packaging – mix timber/metals/foam – timber not recycled as metal/foam considered as contamination. Is not separated at site level due to labour required

Photograph 8: Non-recyclable packaging – composite paper & plastic

Photograph 9: Non-Recyclable packaging – bulka bags

Photograph 10: Overfull bin (with a high percentage of recyclables)

Photograph 11: Overfull bin (with a high percentage of recyclables)

Photograph 12: Overfull bin (with a high percentage of recyclables) - Education

Photograph 13: Food in general waste

Photograph 14: Recyclables and garden waste in general waste stream

Photograph 15: Cardboard and paper in general waste stream

Photograph 16: Plastic in general waste stream

Photograph 17: Plastic strapping in general waste

Photograph 18: Contamination of recycling stream

Photograph 19: Stockpiles of plastic milk/bread containers

Photograph 20: Non-recyclable pallets (Transport/warehousing)

Photograph 21: Healthcare waste and recycling signage

Photograph 22: Local government

Photograph 23: System suited to materials generated

Photograph 24: Plastic bowls in healthcare that were previously disposed of as clinical waste

Photograph 25: Organics waste collection in ERA

Photograph 26: Organic collection

Photograph 27: Paper product bags with a plastic liner which generally are not recycled in ERA

Photograph 28: Mattresses in ERA

Appendix 4 – Waste assessment material categories

Table 245: Waste assessment material categories

	Material type	Equivalent 2008 survey material type	Material description
1	Food organics – unpackaged	Food	Pre- and post-consumer fruit, vegetable, meat, fat, bone.
2	Food organics – packaged	Food	Packaging post-consumer food items.
3	Garden organics	Vegetation	Plant material, leaves, grass, small branches.
4	Wood – untreated	Wood	Pieces of solid timber without any visible signs of treatment. May include timber off-cuts, posts. Timber pallets.
5	Wood – treated/painted	Wood	Pieces of solid timber with visible signs of chemical treatment. CCA treated timber has a green tinge, e.g. “coppers logs”. Wardrobes, painted fence posts, varnished furniture, wooden chairs, doors, etc. Any engineered timber products, old kitchen benches, chipboard, etc.
6	Cardboard – dry	Cardboard	Dry cardboard boxes, printed and branded cardboard. Cardboard off cuts, cardboard rolls, clean dry cardboard. Waxed cardboard, such as fruit boxes, etc.
7	Cardboard – wet	Cardboard	Wet cardboard, soiled cardboard.
8	Paper – office	Paper	Photocopy paper, books, printing and writing papers, magazines, catalogues, brochures and leaflets.
9	Paper – packaging	Paper	Coated and uncoated paper packaging.
10	Paper – other	Paper	Newspapers, kraft paper, rolls of low-grade paper, hand towels, contaminated paper.
11	Plastic – rigid packaging	Plastic	Plastic bottles and jars – margarine, food/beverage containers (PICs 1–6).
12	Plastic – film packaging	Plastic	Film wrap, plastic bags (not filled).
13	Plastic – EPS foam	Plastic	Packaging foam.
14	Plastic – other	Plastic	All other plastics not elsewhere classified. Details to be noted.
15	Glass – packaging	Glass	Glass bottles and jars.
16	Glass – non-packaging	Glass	Window glass, windscreens, broken bottles, non-recyclable glass such as wine glasses.
17	Metal (ferrous) – packaging	Metal	Packaging items that are mainly steel/iron.
18	Metal (ferrous) – non-packaging	Metal	Non-packaging items that are mainly steel/iron.

19	Metal (non-ferrous) – packaging	Metal	Aluminium cans, trays and foil.
20	Metal (non-ferrous)– non-packaging	Metal	Aluminium siding, copper wire, any items that are mainly non-packaging related metal but are not steel/iron.
21	Textiles & leather	Textile	Rolls of carpet, carpet off-cuts, carpet tiles, felt or foam underlay, synthetic underlay (but not rubber or plastic underlay). Clothes, rags, rolls of fabric, fabric off-cuts. Material/leather-covered chairs and couches. Leather off-cuts.
22	Rubber	Rubber	All tyres (full and shredded) and inner-tubes Rubber mats, rubber tubes, rubber washers, foam rubber.
23	Electrical and electronic – TVs	Whitegoods and electrical (details required)	Televisions.
24	Electrical and electronic – computers and peripherals	Whitegoods and electrical (details required)	Computers, monitors, photocopiers, fax machines, printers, etc. Toner cartridges from photocopiers, printers, etc.
25	Electrical and electronic – whitegoods	Whitegoods and electrical (details required)	Washing machines, fridges, etc.
26	Electrical and electronic – other	Whitegoods and electrical (details required)	Includes small appliances. Details to be noted.
27	Masonry materials – concrete/bricks	Construction and demolition material	Any concrete, bags of cement dust, etc. Full-bricks, broken bricks Roof tiles, clay tiles – whole or broken. Stones, uncontaminated soil, Inert material not elsewhere classified. Asphalt, bitumen.
28	Masonry materials – other	Construction and demolition material	Includes plasterboard, gypsum. Details to be noted.
29	Other (including hazardous and fines <10 mm)	Other, Residues, Hazardous/special	This includes contaminated soil recorded as C&I and residues from a range of processing facilities. Includes materials such as mattresses, batteries and gas bottles which should be recorded separately under the category 'Other'. Includes chemicals, lamps, ceramics, clinical waste including sharps and cytotoxic wastes, contaminated material (note type) and batteries including larger lead/acid batteries (note type). Details to be noted.
30	Garbage bags	Garbage bags	Enclosed bags of garbage.

	General Waste			
	Cardboard			
	Paper			
	Comingled (recyclable containers)			
	Food Organic			
	Confidential documents			
	Metals			
	Soft Plastic			
	Other (specify).....			

To assist in meeting the EPA objectives which is to profile waste composition by industry sector we would appreciate if the following could be available on the day of the site assessment:

- o- Data on waste and recycling volumes collected for the previous 12 month period
- o- Details of any initiatives undertaken to reduce waste to landfill
- o- Total number of hours of operation of the business per year

Audit Sheet

Bin Number					
Bin Location

PART B – TASK DESCRIPTION

Step	Hazards	Risk	Control Measures & How They Are Implemented, & Monitored	Responsible Person
General Awareness of risks and safety	Non-familiarity with sites and waste assessment process	Low 2	<ul style="list-style-type: none">During the period of the waste assessment, a daily safety briefing will be conducted by the Project Manager to remind auditors of all risks and safety protocols.	Project Manager and Auditor
Transit to and from audit site	Collision with another vehicle	Low 2	<ul style="list-style-type: none">Auditors will be trained as to hazards and will be required to adhere to road rules.Auditors to be made aware of audit location and traffic/pedestrian interfaces in audit induction training	Project Manager and Auditor
Site familiarisation	Sprain/broken bone due to fall	Low 3	<ul style="list-style-type: none">Auditors complete individual site inductionsAuditors will be advised to discuss safe walkways with the Site Operators.Each Auditor will conduct a review of all sites to ensure they are fully familiar with the layout.Auditors will all wear sturdy boots and advised to exercise due care when moving on site.	Auditor
Waste assessment preparation	Dehydration	Low 2	<ul style="list-style-type: none">All Auditors will have a water flask that must be full and taken to the site each day.Auditors will be made aware of this risk and the signs associated with early warning.	Auditor
Access material for inspection	Contact with vehicles	Low 2	<ul style="list-style-type: none">Complete site specific inductionWear high visibility clothing/footwear and any other site specific PPE requirementsConstantly aware of environment (eg; location of vehicles, machinery operation)Remain within sight of vehicle operator (s)	Project Manager and Auditor
Record data	Contact with vehicles	Low 2	<ul style="list-style-type: none">Move clear of vehicle areas while recording data.	Project Manager and Auditor
PPE to be worn	Skin burn due to contact with chemicals	Low 2	<ul style="list-style-type: none">Auditors are not to reach into any waste containerAuditors are advised not to open containers containing liquids, or to handle any chemicals or powders.Long sleeved shirts and pants and/or coveralls and chemical resistant gloves to be worn to reduce potential for skin contact by liquids.Water and first aid kit will be available on each site.	Auditor

2

UNCONTROLLED IF PRINTED. CONTROLLED COPY TOXFREE INTRANET <http://quest>

PPE to be worn	Breathing difficulties due to dust	Low 2	<ul style="list-style-type: none"> • Auditors will be provided with facemasks to be utilised during the project. 	Project Manager and Auditor
PPE to be worn	Eye injury due to dust/chemical/puncture.	Low 2	<ul style="list-style-type: none"> • Auditors will wear safety glasses on site at all times. 	Project Manager and Auditor
PPE to be worn	Damage to hearing due to loud noise	Low 2	<ul style="list-style-type: none"> • Where auditors are working in noisy areas, hearing protection will be worn. In these instances particular care must be taken to ensure that warning noises, ie reversing vehicles can still be heard. 	Project Manager and Auditor
Safe Handling	Back injury due to lifting	Low 2	<ul style="list-style-type: none"> • Duties will be rotated during the day/week to ensure that no one person is constantly bending or lifting waste/bins/scales 	Project Manager and Auditor

PART C – CONSULTATION & REVIEW

The WMS describes the controls for a class of hazards (MWH&S Regulation 12) from this task, specific risks are assessed by the Operators through a Five X Five. Through the Five X Five the Operators confirm:

- They have read and reviewed this WMS and understand the task and risk controls.
- They have conducted a Step Back Five BY Five assessment to check for additional risks which may arise during the task onsite.
- They will follow this WMS and its controls.
- They will monitor and check the job whilst we work to ensure no other risks arise.

NAME	SIGNATURE	DATE	NAME	SIGNATURE	DATE
Sandy Casaroli					
Oliver Batchelour					
Matthew Bielby					
Trevor Thornton					
Skye Blackley					
Scott Ebsary					
Robyn Pearson					

PART D – INSTRUCTIONS

Preparing the WMS - This WMS is provided to provide safe methods of work in accordance with Toxfree's legal requirements. The WMS are provided as a safe means of work for generic classes of hazards in accordance with the MWH&S Regulation 12. During development Operators and Staff are actively consulted. Further input and change is encouraged through the Issue Resolution and Investigation procedure.

Completing the WMS - Before starting work on this task ALL personnel MUST read the WMS.

Step Back Five BY Five assessment of the site risks MUST also be conducted and risk controls recorded. Attach Step Back Five BY Five to job paperwork.

WMS used must be recorded on the Client Worksheet or Job Run Sheet whichever is applicable.

EACH Operator, visitor or person onsite is to read the WMS and Five BY Five and sign their name in on the Five X Five acknowledging their understanding, consultation and acceptance of the risks, necessary controls and their responsibilities. If necessary attach extra sheets.

During the job risks are to be monitored and further Five BY Five's conducted as necessary to ensure all risks are controlled.

Conducting the risk assessment - For each hazard identified assess:

- **CONSEQUENCE** – How bad things could be if there is an accident/incident by reading from the left hand side of the matrix to determine if the consequence is HIGH, MODERATE or LOW, then
- **LIKELIHOOD** – Determine how likely is this accident/incident to occur by reading across the bottom. Is it ALMOST CERTAIN, POSSIBLE or RARE, then
- Join the two, where the consequence row and the likelihood column meet is the possible risk level. Use matrix below

Once risks are identified work out best way controlling risk to ensure no harm. If necessary stop the task until you are assured that the risk is acceptable.

Review & Retention - All WMS are progressively reviewed by the QUEST Manager.

Site specific WMS are to be reviewed regularly as required to control the risk, this is to be stated in Part 1.

WMS are to be retained for the duration of the project. If an incident occurs the WMS is to be retained in accordance with the Issue Resolution and Investigation Procedure.

RISK ASSESSMENT MATRIX				
CONSEQUENCE	HIGH Very bad could cause serious harm	5 MEDIUM Fix issues ensure safe to proceed.	15 HIGH STOP	25 EXTREME STOP Seek guidance
	MODERATE Could cause harm	2 LOW Fix hazards, continue task.	8 MEDIUM Fix issues ensure safe to proceed.	16 HIGH STOP
	INSIGNIFICANT Not likely to cause harm	1 NEGLIGIBLE Watch hazards	3 LOW Fix hazards, continue task.	9 MEDIUM Fix issues ensure safe to proceed.
	RARE Not likely to happen	Possible Could Happen	POSSIBLE Could Happen	ALMOST CERTAIN Probably will happen
LIKELIHOOD
