

To whom it may concern,

Our forests are vital to the health and wellbeing of all generations and species.

Biodiversity is imperative if we are to have healthy air, water and total beings.

It is being increasingly scientifically proven that forests emit frequencies, energy and chemicals which increase mental and physical health of humans - not to mention all species which call forest their home.

We must allow the trees opportunity to grow to mature age, as their age brings with them attributes and qualities which younger trees do not, such as seed production; platform for other species to grow like ferns, stags, as well as nesting hollows, fungi; support + protection for their own offspring, to later make way for them to grow. Trees are proven to 'communicate' with each other, with 'elder' trees having most influence on its community - not unlike a wise elder whom is respected in some cultures of the human race..

Please let our forests strive to old age for increased biodiversity and richness so every animal, mineral + vegetable will benefit.

Forests will survive without us humans; however we cannot survive without them. Please Spare Corunna Forest.

Bonny Smith
